

Lie and say we are version 3.00....

Won't work. EMM386 will break. QEMM won't work properly anyway.  
386Max will gag and blow up. You will break all sorts of other  
non-LIMulator guys like WINA20.386 that comes with DOS 5.00.  
This is one of the bugs that is fixed via the QEMM patchy watchy  
code (as I recall, it was a jump sense bug, jump zero instead of  
jump non-zero).

Splat. <sound of great wall being hit>

they should use toolhelp.

When you hit problems that were caused by Apps exploiting undoc  
behavior based on source access, PLEASE WRITE THEM DOWN and send to  
Phil. Phil, please own this. We often make the claim in defense of  
not giving out source, but need to back up the claim.

| Unless Brad overrules, these guys have hit the great wall. They're apps  
| dudes, Watson is part of the system.

| <Extraneous stuff deleted>

| Is it really proper for those guys to be poking around in

| our code at all?

| I have been involved in tracking down way too many bugs  
| where Microsoft APPS group code was doing unbelievably  
| slimy things because they obviously were looking at our  
| sources and depending on wildly undocumented behavior. One  
| way we can shut down some of these problems, in my opinion,  
| is to shut down outside access and make them use the normal  
| APIs just like everyone else.

| My two bits worth,

| -JonT

| Terri,

| One of our ex-systems people over in apps (Spitfire mail server) is  
| interested in some of the stuff that you folks do in Dr.Watson. How  
| would he go about getting read access to some of the DrWat code? Is it  
| occasionally granted or is he going to run into the great wall?

| Thanks,

| Andy

| ...

| 2) Do you have pointers to where the WINDOWS source lives, and any necessary  
| passwords to access it. I am looking for the sources to Dr.Watson. There  
| are some tricks that DrWatson performs that we would like to see how they  
| did it.

| thanks - Steve
