Has anyone ever sent me a proposed list of ASTRO features?
I want QEMM functionality and Stacker functionality in order for
it to be exciting.

Did you read the pc weel review of RYBS ATLast? (page 21 this week).
Looks like a pretty interesting memory management product.

I think to be successful a DOS update has to have the following features:

- more usability of common commands
- integrate utilities that are popular (there are few of these)
- some cool feature people hadnt thought of generally
- extra speed in some noticeable areas
- match the garbage that DR DOS does
- provide benefits to powerful machines so they feel good having power
- work better with windows

I dont know how your current astro specification measures up to this.
Maybe we should brainstorm some. Of course since a lot of this is just
buying stuff its hard to know whats cheap but we should have a PLAN.
