Dave-

I think we can bring up the STRT dialog with the countdown timer, but we absolutely cannot pause the player like we do in WMP6 while the dialog is up.

However, this is the same situation that we have with the STRT dialog in the QuickTime player - bring up the dialog, suggest that the user pause his/her player until the countdown timer goes to zero, and that's it.

I'll look into it tomorrow if you think it's worth it. Let me know.

Thanks
Brad

Brad,

Can you give the 'Slower than Realtime' a good shot. We're so close, let's give it one more try.

Dave

Another update:

It appears that Linh Dang has gotten MPEG (and other non-ASF format) support to co-exist with the URLMON approach for WMP7 (i.e. #3 below). So now, the only functionality not available is "Slower than realtime" and "pause on data starve" for ASF only. Both of these will be working for MPEG however.

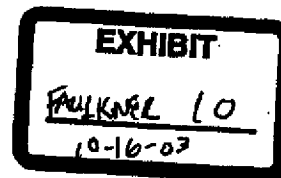

We're not planning any further investigation to get these last items working (since it's probably not possible).

Brad

Brad,

Thanks for the update and the quick work.

Folks-

We've fixed the seeking problem for the URLMON approach in WMP7, so we expect to be able to satisfy #2 below.

Still looking at #3, specifically trying to find a method by which we can get MPEG and other non-WMF formats to work in WMP7.

Thanks
Brad

1) long-term, wmp7 must support live .asf files with full functionality. (seek, slower than real time, etc.) this means we must use the wfedk, and are proceeding in this direction for the Holmes release.

LICENSING ISSUES WILL BE RESOLVED BY MARKETING

1) short term, we must show an ability to play and seek archived .asf files using wmp7. this product should be fully tested within its specific, limited capabilities.

3) the problems of coexistence between wmp7/wmp6 (other file types, installation, etc.) must be worked out.

4) this effort will have an impact on the holmes release date - to be quantified.
