**Subject:** RE: Need some priority discussion/direction/decision on

I agree about the Interzest issue and have already been working on that

The main questions for you are

- #1 - is it ok to release and demo the alpha without a license
- and #2 - Is Solaris support a critical item given SBC and Bell South?

My gut is saying yes but this will have a significant impact on live and other projects so it needs a higher authority.

Thanks

Kyle

I would put Interzest at the top of the list for remedial action. Richard

**Issue of the Day**

We have no license for WMF SDK for Live Manager  
This appears critical to release (and demo) of Alpha.  
Mike is comfortable releasing without an agreement but I am not.  
This has to be Doug and Richard call.

**Solaris Bug Fix - Bell South and SBC**

There has been a known and publicised issue with the solaris platform in our current released product.  
Agreement with product planning was release 3.0 but given recent developments this needs to be re-visited.  
Potentially major negative impact on other schedules  
Already about 2 engineering months expended without results  
We have some approaches to take but is an unknown.

Interzest - hung clients issue, they seemed quite upset  
We have a theory but would need to do work to get a patch release out  
Could provide remote reboot capability as a stop gap  
Gut feeling is we need to work on a patch release but need guidance.  
So far asking them for better information has not been successful but is continuing.

Demo of Live - In order to demo live of Internet World we need machines

CONFIDENTIAL

Plaintiff's Exhibit

Technically I think we can field a good demo of the Alpha.  
Are we demo'ing at Internet world?
