ok, post a nice SOL message. bottom line is that he needs
msdos -- something that is compatible with windows.

i have already passed on to sergiop. you may also want to
pass on to richardf, jeff, ronh and joachimk.

Bradsi, We need to get an answer posted for this guys asap
I'd like to just tell him that he is SOL, but in nicer terms
of course. I'll just clone all the postings you've already
done on this. You OK with that.

Bradc, who in OEM should this guy talk with about putting
MS-DOS in ROM. We should just get them connected now.

| I know this may not be a surprise, but what do you want me to tell this
| guy? He seems to have a major problem. Thanks!

| Hi Steve,
| I have a huge problem.
| My Company has spent a BIG sum to be able to burn DR DOS into our
| Notebook (touch screen) computers' bio'S. MicroSoft would not even
| talk to us about doing that so we are stuck with our only option.
| I have so many problems running Windows on 6.0 DR DOS that it doesn't

| deserve a bug report, it won't get that far! We are counting on Windows
| for Pen computing, (which run's flawiesly on DR 5.0)
| What can we (I) do?
| Windows does not recognise the EMM386 driver nor the IPX (novell)
| driver, I get 2 or 3 error numbers when it boots (without any cache or
| memory drivers working) And you are all I have to help me.
| I need some help.
| Marty

| Unfortunately there is little we can do to help this person at
| this time. DR DOS will need to rev to work w/ Windows 3.1
| just
| like QEMM and 386max have to rev. This is due to its mapping of
| memory and the assumptions it makes about memory that Windows
| 3.1 uses.
|
| I'll also pass his name on to SaraO and see if OEM wants to
| contact him.
|
| Janine

||Sb: #36102-DRDOS compatibility
||Fm: Marty Borgen 72561,2173
||To: Howard Weingarden 70771,2656
||
|| This is a really big issue with us. DFM Systems (the company I
work for)
|| Manufactures a Touch Screen Notebook computer and planned on using
Windows
|| for Pen computing.
|| We also "burn" DR DOS into a pseudo drive in the BIOS. If Windows
won't
|| work with DR 6.0 it will be a big mess.
|| I can get windows to come up, but so far it has mucho problems.
|| With EMM386 (it claims it (windows) can't load the driver,
|| I can load the network drivers, and login, however, vpihx claims
that the
|| driver is not loaded, there are 2 or 3 error numbers that I have to
|| <C>ontinue thru, and I haven't yet gotten SuperPCK to run, nor
SuperStore.
|| needless to say, performance is not pretty.
|| I upgraded the machine I use day to day with DR 6 and had to resort
to my
|| floppy boot disk to continue with my daily work.
|| We already have a sizeable investment in DR DOS, and MS won't let

us
|| "burn" DOS into our bios, so it _HAS_ to work.
|| Windows for Pen work's fine with DR 5.
|| So it go's
|| I would appreciate hearing from anyone who has suggestions,
comments about
|| how to " make it work".
|| Marty
||
